

1. Description:

- What is the problem you are creating the custom mini-agent to solve?
 - I want to create an assistant that can refer to building codes as well as design manuals. There are 1000's of pages of text to reference from. Having an agent that can recite the codes based on what you're looking to accomplish helps with reducing research time and provides a more detailed design.
- Who would use this type of custom mini-agent?
 - Structural design professionals or trainees, but swapping the knowledge can result to same output for other intended use.
- What is the type of information, context, background knowledge, or situational-awareness the mini-agent should have or understand?
 - The agent will need to understand that it is a structural assistant intended to provide code assistance. Safety is a key priority and if it can't provide an answer, to let the user know immediately.
 - Building codes and various design manuals
 - Ex. ACI, NDS, AISC... etc.
- What are the expected outcomes the mini-agent should produce to be helpful or effective?
 - Outcome is to provide context on the question subject that is directly pulled from the knowledge pool with reference to its location. For example, if a question asks for the minimum reinforcement on a slab, it will pull from the ACI manual with reference location and provide context to its requirements. The mission for the mini agent is to be an assistant that can help expert engineers as wells as a guide for trainees.
